

The time to update your base specification to lead free is now

Are you ready for the change?

There are big changes coming with the new NCC 2022. And one of them will impact every new commercial build project in Australia.

In response to a decision by the Australian Building Codes Board, new standards for plumbing products intended for use in contact with drinking water will limit the weighted average lead content to not more than 0.25%.

The inclusion of the new requirement means that from 1 May 2026, plumbing products that do not conform to lead free requirements will no longer have valid certification and will not be authorised for installation if in contact with drinking water.

While 2026 might sound like a long time away the time to prepare and update your base BIM spec is right now (*turn over to see timeline*).

Discover our NCC 2022 compliant GalvinClear® Lead Safe™ solutions

As Australia's leading experts in lead safe water solutions, Galvin Engineering has been preparing for this move for years, offering an extensive range of compliant lead free drinking and handwashing solutions for education, healthcare and public areas today.
