

Linear 153 - Frameless Glass Sliding Door System

It is possibly the most interesting sliding door gear available today. Designed for frameless glass panels up to 250kg in weight.

The bottom rollers are fitted directly through the glass meaning no bottom rails are required to house rollers. This in turn makes for a very appealing look.

The Stainless Steel Wheels have a Black Acetal tyre so the operation on the Stainless Steel Track is both smooth and silent.

Because all the weight is loading on the floor, the transom does not have to be constructed to carry the full weight of the door as is the case for top hung doors.

This system lends itself for use in domestic or office situations as a room divider and can be used in cavity sliding applications.
